

Image Data Analysis

- Image is a special kind of data where data is in the form of matrices.
- When we have image in the form numbers arranged in a matrix, we can do all matrix operations.

NumPy Matrix

```
In [1]: import numpy as np
```

```
In [2]: mat = np.matrix([
        [1, 2, 3, 4, 5],
        [3, 4, 5, 6, 1]]
    )
```

```
In [3]: mat.shape
Out[3]: (2, 5)
```

Transpose Operation

```
In [4]: mat.T
```

```
Out[4]: matrix([[1, 3],
               [2, 4],
               [3, 5],
               [4, 6],
               [5, 1]])
```

Scalar Multiplication

```
In [5]: 3 * mat
```

```
Out[5]: matrix([[ 3,  6,  9, 12, 15],
               [ 9, 12, 15, 18,  3]])
```

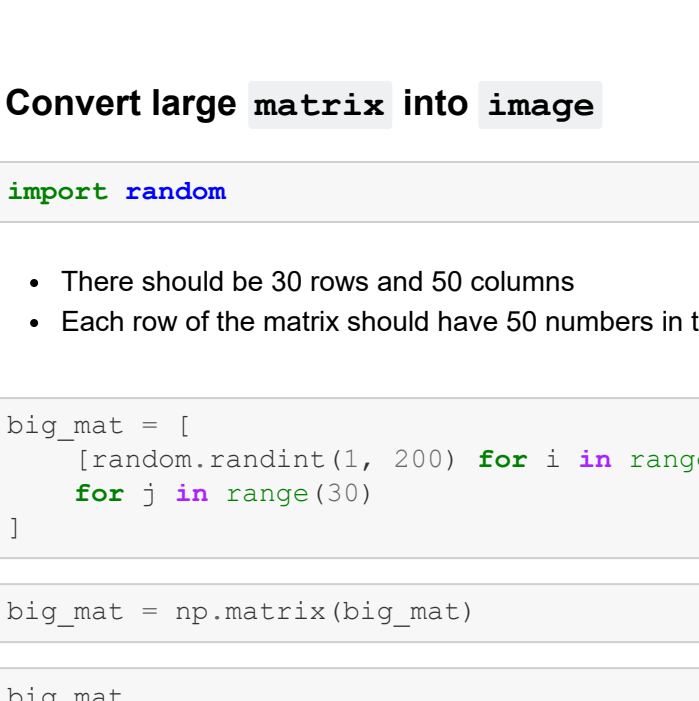

Can we convert matrix into image ?

```
In [6]: from matplotlib import pyplot as plt
```

`imshow()` of `plt`

```
In [7]: mat
Out[7]: matrix([[1, 2, 3, 4, 5],
               [3, 4, 5, 6, 1]])
```

```
In [8]: image_mat = plt.imshow(mat, cmap='Reds')
        plt.colorbar(image_mat)
        plt.show()
```

Convert large matrix into image

```
In [9]: import random
```

- There should be 30 rows and 50 columns
- Each row of the matrix should have 50 numbers in the range of 1 and 200

```
In [10]: big_mat = [
        [random.randint(1, 200) for i in range(50)]
        for j in range(30)
    ]
```

```
In [11]: big_mat = np.matrix(big_mat)
```

```
In [12]: big_mat
```

```
Out[12]: matrix([[ 4,  30,  36, ...,  56,  46, 113],
               [ 96, 172, 142, ...,  95,  32,  59],
               [ 71,  54,  14, ..., 148, 106, 165],
               ...,
               [128,  75, 110, ..., 151, 174,  27],
               [123, 193, 143, ...,  57, 112, 102],
               [ 21,  90, 148, ...,  34,  58, 163]])
```

```
In [13]: big_mat.shape
Out[13]: (30, 50)
```

Matrix to Image

```
In [14]: image_mat = plt.imshow(big_mat, cmap=None)
        plt.colorbar(image_mat)
        plt.show()
```

Transpose matrix to Image

```
In [15]: trans_mat = big_mat.T
        timage_mat = plt.imshow(trans_mat, cmap=None)
        plt.colorbar(timage_mat)
        plt.show()
```

grayscale image

```
In [16]: gray_image = plt.imshow(big_mat, cmap='gray')
        plt.colorbar(gray_image)
        plt.show()
```

How can we convert image into matrix ?

We should use `cv2` (`opencv-python`) package in python to compute matrix operations on images.

```
pip install opencv-python --user
```

A typical **colored image** is comprised of pixels (which are represented as RGB pixels).

- A pixel is simply a number in the range of 0 to 255 for all **R**, **G**, and **B**.
- R** → Red → 0 to 255
- G** → Green → 0 to 255
- B** → Blue → 0 to 255

Image by Author

Some important colors and their RGB values -

- pixel → [R, G, B]
- Red → [255, 0, 0]
- Green → [0, 255, 0]
- Blue → [0, 0, 255]
- White → [255, 255, 255]
- Black → [0, 0, 0]
- Yellow → [255, 255, 0]
- All colors → <https://www.colorhexa.com/color-names>

Let's read the image and convert into matrix

The image that we will read is -

Read the **image** in the form of **matrix**

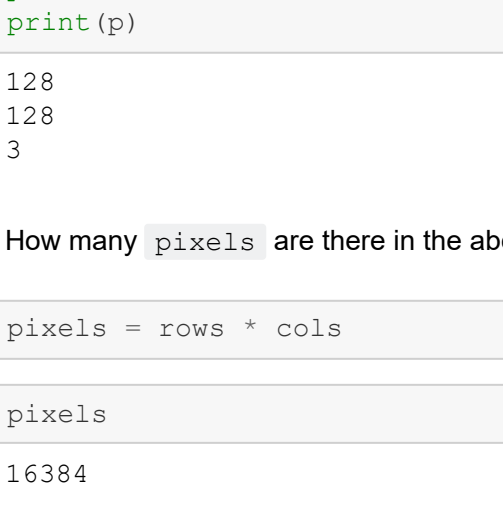

```
In [17]: import cv2
```

```
In [18]: image_mat = cv2.imread('lena_image.png')
```

The image matrix would be like -

```
[[[159 183 255] ... [142 202 255]]
 [[140 169 255] ... [ 87  74 159]]
 [[118 164 255] ... [ 62  14  81]]
 ...
 [[ 64  30  96] ... [ 61  33 119]]
 [[ 61  27  92] ... [ 74  65 178]]
 [[ 60  25  89] ... [ 80  72 202]]]
```

```
In [19]: plt.imshow(image_mat)
        plt.show()
```

- By default, the image is read in BGR format.
- We need to convert it into RGB format for our convenience.

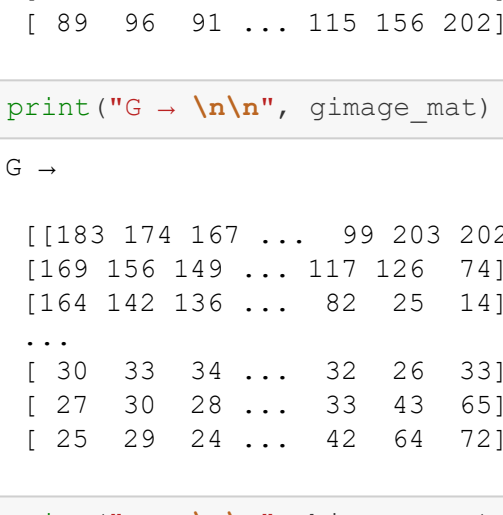

BGR → to → RGB format

```
In [20]: image_mat = cv2.cvtColor(image_mat, cv2.COLOR_BGR2RGB)
```

The image matrix would be like -

```
[[[255 183 159] ... [255 202 142]]
 [[255 169 140] ... [159  74  87]]
 [[255 164 118] ... [ 81  14  62]]
 ...
 [[ 96  30  64] ... [119  33  61]]
 [[ 92  27  61] ... [178  65  74]]
 [[ 89  25  60] ... [202  72  80]]]
```

```
In [21]: plt.imshow(image_mat)
        plt.show()
```

Shape of the image matrix - rows and columns

```
In [22]: image_mat.shape
```

```
Out[22]: (128, 128, 3)
```

```
In [23]: rows, cols, p = image_mat.shape
        print(rows)
        print(cols)
        print(p)
```

```
128
128
3
```

How many pixels are there in the above image?

```
In [24]: pixels = rows * cols
```

```
In [25]: pixels
```

```
Out[25]: 16384
```

How many pixel values are there including **R**, **G**, and **B** values?

```
In [26]: pixel_values = rows * cols * p
```

```
In [27]: pixel_values
```

```
Out[27]: 49152
```

Separate **R**, **G**, and **B** from the image

Image by Author

We make use of `cv2.split()` method to separate the **RGB** pixels from the image.

```
In [28]: rimage_mat, gimage_mat, bimage_mat = cv2.split(image_mat)
```

```
In [29]: print("R → \n\n", rimage_mat)
```

R →

```
[[255 255 255 ... 212 255 255]
 [255 255 247 ... 227 227 159]
 [255 246 232 ... 190 103  81]
 ...
 [ 96 100 100 ... 105 100 119]
 [ 92  97  95 ... 105 124 178]
 [ 89  96  91 ... 115 156 202]]
```

```
In [30]: print("G → \n\n", gimage_mat)
```

G →

```
[[183 174 167 ...  99 203 202]
 [169 156 149 ... 117 126  74]
 [164 142 136 ...  82  25  14]
 ...
 [ 30  33  34 ...  32  26  33]
 [ 27  30  28 ...  33  43  65]
 [ 25  29  24 ...  42  64  72]]
```

```
In [31]: print("B → \n\n", bimage_mat)
```

B →

```
[[159 148 142 ... 101 163 142]
 [140 130 124 ... 107 113  87]
 [118 115 113 ...  83  64  62]
 ...
 [ 64  66  71 ...  63  58  61]
 [ 61  63  67 ...  62  68  74]
 [ 60  62  64 ...  72  82  80]]
```

Plot **R**, **G**, and **B** separately

```
In [32]: cmap_values = [None, 'Reds', 'Greens', 'Blues']
        titles = ['Original', 'Red Lenna', 'Green Lenna', 'Blue Lenna']
        image_matrices = [image_mat, rimage_mat, gimage_mat, bimage_mat]

        fig, axes = plt.subplots(nrows=1, ncols=4, figsize=(15, 10))

        for i, ax in zip(range(4), axes):
            ax.axis("off")
            ax.set_title(titles[i])
            ax.imshow(image_matrices[i], cmap=cmap_values[i])

        plt.show()
```

Some matrix operations

- Let's take grayscale matrix of original image

```
In [33]: gray_image = cv2.imread('lena_image.png', 0)
```

```
In [34]: gray_image.shape
```

```
Out[34]: (128, 128)
```

```
In [35]: plt.imshow(gray_image, cmap='gray')
        plt.show()
```

Tranpose gray lenna

```
In [36]: trans_lenna = gray_image.T
```

```
In [37]: plt.imshow(trans_lenna, cmap='gray')
        plt.show()
```

```
In [38]: image_mat.shape
```

```
Out[38]: (128, 128, 3)
```

How can we transpose colored image?

Since each pixel is a combination of 3 values, we have to -

- separate **R**, **G**, and **B** matrices
- apply transpose operation to all the 3 matrices
- merge **R**, **G**, and **B** matrices as a one single matrix

```
In [39]: # separation of R, G, and B
        rimage_mat, gimage_mat, bimage_mat = cv2.split(image_mat)

        # transpose operation to all the 3 matrices
        trans_r = rimage_mat.T
        trans_g = gimage_mat.T
        trans_b = bimage_mat.T

        # merging R, G, and B matrices into one single matrix
        trans_color_lenna = cv2.merge((trans_r, trans_g, trans_b))

        # plotting the transposed colored image
        plt.imshow(trans_color_lenna)
        plt.show()
```

Other operations

- Image Flipping
- Image Mirroring
- Image Equalization (One of the mind blowing operations)
 - Used for enhancing the contrast of an image
- Image Binarization
- Image Inversion
- Image Cropping
- Image Bordering
- Image Convolution with kernels (One of the mind blowing operations)
 - Used for Smoothing, Blurring, Edge detection etc

PS: All you can find in my blog websites.
